

This BPL system cannot be put into use. Its another source of interference and problems confronting everybody. It will add more complaints made by the public because everything manufactured today that has any electronics causes or can be intereferred with by something else. I am a radio amateur N9IA and hold an amateur extra class license and a commercial radio license. As the technology moves forward, being able to utilize the airwaves becomes more difficult everyday. People use door opens, toothbrushes, toys, alarm systems, cordless phones just to mention a few common items that interfere with the radio reception. Not only for radio amateurs but people just trying to listen to Am radio stations. When the radio amateur try to transmit the signal causes interference with these common items. The manufactures do nothing to elimenate these problems.

The addition of Broadband Transmissions will be the end of radio amateur and other government, security, emergency and other radio services.

The radio amateur is allowed to transmit with power outputs that will do great interference with the BPL receiving equiptment causing more complaints to both the FCC and to the radio amateur!

BPL just cannot be allowed!

My vote is obviously NO.

David R. Patton. N9IA
